## ALIGNMENTS

Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G /note= "Wild type Glu substituted with Gly; This corresponds to position 222 in the wild type protein" /note= "Wild type Phe substituted with Leu; This corresponds to position 64 in the wild type protein" Jellyfish; green fluorescent protein, GFP; protein redistribution, cellular function; genetic reporter; mutant; Stoke's shift; mutein. Enhanced F64L-E222G jellyfish green fluorescent protein mutant Location/Qualifiers Thastrup 0; Ā 19-JUN-2000; 2000DK-0000953. 20-JUN-2000; 2000US-02126BIP. 10-MAY-2001; 2001DK-00000739. 10-MAY-2001; 2001US-0290170P. 18-JUN-2001; 2001WO-EP006848 (first entry)

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at F64% and B226 has a bigger compared to other GFP's making it very cuitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution. The fluorescent protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker for changes in cell morphology, as transfection marker, and as a marker to be used in combination with fluorescence activated cand as a marker to be used in combination with fluorescence activated consitor is also useful as markers in transcriptional and translational protein is also useful as markers in transcriptional and translational contein is also useful. Transposon vector mutagenesis and as a reporter for batterial detection. Transposons encoding the fluorescent protein are useful for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein are useful for designing diagnostic tool. The present sequence is a DNA encoding enhanced F64L-E222G jellyfish green fluorescent protein (GFP) mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HC1) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful intracellular proteins. The present sequence is used in the exemplification of the invention

```
The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Rolipram-like reference compound, and testing if it inhibits the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDB spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for identifying compounds useful for the treatment of diseases of the central continhibit as depression and for the treatment of inflammatory disease. The method is useful for identifying compounds useful for the treatment of inflammatory disease. CC disease, respiratory diseases, or normic obstructive pulmonary disease. CC disease, respiratory diseases, chronic obstructive pulmonary disease. CC disease, bone resorption diseases, repetitusion injury, cancer and HIV inflammatoric programment of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracallular distribution of the PDB for the preparation of a medicament. The present services are all and a sequence of a HSPDE4Al-E222G fusion
                                                                                                              Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDE4 spots, which may optionally be induced by a Roliptram-like reference compound, and testing if it inhibite the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for identifying compounds useful for the treatment of diseases of the central nervous system such as identifying compounds useful for the treatment of inflammatory diseases such as joint inflammation, Crohn's disease, inflammatory bowel disease, respiratory diseases, chronic obstructive pulmonary disease (ODPD), including asthma, chronic bronchtis, pulmonary emphysema, endotoxis shock toxic shock syndrome, systemic lugue srthematosis, bone resorption diseases, reperfusion injury, cancer and HIV infection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDB4A4-E222G fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               954 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 1013
                                                                                                                                                                                                                                                                                                                                   Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G
                                                                            /note= "Wild type Phe substituted with Leu, This corresponds to position 64 in the wild type protein"
Jellyfish; green fluorescent protein; GFP; protein redistribution; cellular function; genetic reporter; mutant; Stoke's shift; mutein.

```

The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at F64L and E222G has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein redistribution. The fluorescent protein is useful in studying cellular functions in living cells; as protein tags in transganic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker to be used in combination with fluorescence activated cell sating (FACS). The novel proteins can also be used as resporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational contents of the protein is also useful as markers in transcriptional and as a reporter content or an experient content or and as a marker of the protein is also as a reporter or and as a reporter or and as a marker or and as a marker or or content or or organisms, such as fungi. The fluorescent fusions for performing transposon vector mutagenesis and as a reporter or an experient or and as a reporter. for bacterial detection. Transposons encoding the fluorescent protein are 61 LVTGLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120 9 9 useful for screening promoters and for tagging plasmids and chromosomes. The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest, cause an allocate actions. The methods of the biosensors comprise hear shock proteins alteration in the cellular distribution of at least the fluorescent conject. In one embodiment, the biosensors comprise hear shock proteins (HSPB) fused to a fluorescent protein (e.g., jellyfish green fluorescent protein (e.g., jellyfish green fluorescent protein so a stress activation translocate to the nucleus. In the cytoplasm, but on stress activation translocate to the nucleus. In another embodiment biodetector proteins can be used to detect protease activity. Such protease biodetector fusion proteins comprise one or more fluorescent proteins a recognition signal which is cleaved by the protease, and at least one cellular logalisation signal which is acted upon by the protease, or may be from heferologous sources. Due to the components of a single protein which is acted upon by the protease of interest, the region of the cell. Once acted on by the protease of interest, the fluorescent protein is cleaved from the localisation signal attached to the fluorescent protein signal attached to the fluorescent protein signal attached to the fluorescent protein of the protease recognition sequence. The compartment after cleavage of the protease recognition sequence change in distribution of the fluorescent protein of the fluorescent protein of the methods and imaging methods with a high degree of spatial resolution. The methods and imaging methods with a high degree of spatial resolution.
                                                                                                                                                                                                          Biodetector protein; fusion protein; recognition site; cellular targetting sequence; cellular localisation; fluorescent protein; protease activity detection; toxin detection; cellular stress detection; drug discovery; cell based screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Automated cell-based characterization of toxin by contacting cells containing luminescent reporter molecules with test substance and analyzing optically.
                                                                                                                                                                        Enhanced green fluorescent protein (EGFP), SEQ ID NO:46.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 11; Fig 29A; 336pp; English.

cellular activities and to screen compounds which modulate these example, may be used for the screening of compounds which modulate apoptosis, while biosensors containing a recognition site for caspase, for apoptosis, while biosensors containing other protease recognition sites may be used for the detection of proteolytic toxins (such as anthrax lethal factor). The method provides improved target validation and candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature and speed of data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAB22881-B22885 represent fluorescent proteins which may used as components of biosensor fusion proteins of the invention

                                                                                                                                                        protein based on the Aguarea green fluorescent protein (GFP). The emission intensity changes as pH varies between 5 and 10 of the present protein are novel. The functional engineered fluorescent proteins show reversable changes in fluorescence over physiological pH ranges. They can be used for determining the pH of samples and cells. The polynucleotides can also be used to praduce transgent enimals. The fluorescent protein pH sensors can be delivered to cells in the form of polynucleotides encoding the protein sensor fused to a targeting signal. The targeting signal directs the expression of the protein sensors to restricted cell locations. This makes it possible to measure the pH of a precisely defined cellular region or organelle
                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

The present sequence is that of the EGFP signal domain, which can be included in novel recombinant protease biosensors (PBS) of the invention. The PBS (see AAY79638-54) comprise: a first domain (see AAY79679-87) comprising at least 1 detectable polypepticd signal such as the present sequence; a second domain (see AAY79688-622) comprising at least 1. See AAY79688-622 comprising at least 1. Comprising at least 1 reactant target sequence. A recombinant nucleic comprising at least 1 reactant target sequence. A recombinant nucleic acid (see AAA27627-43) encoding the PB, an expression vector, and a computing the reactant target sequence. A recombinant nucleic acid sentifying compounds that modify protease activity in a cell involves contacting a host cell that possesses the recombinant PB with a test compound, and determining the PB distribution in the host cell, where contacts in the distribution of the PB are correlated with modification of protease activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the protease activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the crecombinant nucleic acid, or the recombinant screens to detect in vivo activation of enzymatic activity, and to identify specific activity based on cleavage of a known recognition motif

The present sequence is a fluorescnet protein used in the construction of a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in which a change is indicative of the effect of the parameter on the sensor polypeptide. The novel fluorescent proteins are advantageous due to their reduced size as compared to the FRET (fluorescence resonance energy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LVTGLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                                         The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region and a fluorescent polypeptide region and protein goined directly, or via a linker, to the carboxy side of the MCHR polypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. The present sequence represents a A. victoria green fluorescent protein (GFP) and a linker

The specification describes a method for assessing the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The present sequence represents a green fluorescent protein (GFP), and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LVTGLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                  The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformant transformed by a recombinant vector comprising the gene, where the transformant is cultured and the protein is collected from the culture. The present sequence represents the A. victoria green fluorescent protein (BGFP)
                                                                                                                                                                                                                                                                                    9

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent reporter molecules (I) in array of locations with a test substance, where (C) are detectors, classifiers or identifiers, imaging cells in each clocation to obtain luminescent signals and converting optical information control digital data to interpret presence of toxins in the test substance. The method are useful for detection of toxins chosen from proteases, ADP-cribosylating toxins, cytocoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as detectors, classifiers and identifiers are described and serve as creporters of toxic threat agents. The first two levels of characterisation ensure a rapid readout of toxin class without sacrificing the ability to detect many new mutant toxins or dissect several complex mixtures of known toxins. This is the amino acid sequence of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for mutagenesis that comprises synthesising a mutated strand and a complementary strand by use of synthesising a mutated strand and a complementary strand by use of megaprimers. The method basically comprises a DNA synthesis in which one or more primers that have a nucleotide sequence containing at least one and then subjected to an elongation reaction using a thermostable bush. It idelity DNA polymerase, after which the phosphorylated 5'-terminus and the elongated terminus are ligated by means of a thermostable DNA ligase the step of DNA synthesis is repeated several times to amplify the DNA containing the primers; a digestion in which the step of DNA synthesis is repeated several fragments of amplify the DNA containing the primers and then, at least DNAs other than the amplified circular DNA are digested into several fragments obtained in the step of digestion as megaprimers, the megaprimers are annealed to the circular DNA synthesised above, followed by an elongation reaction performed using the thermostable high-fidelity DNA polymerase. The method is useful for mutagenesis, particularly for introducing certain mutations at certain sites of the nucleotide sequence. The present method is simple, speedy, economical and widely applicable. The present method is simple, a pepedy, economical and widely applicable. The present sequence is Aequorea victoria enhanced green fluorescent protein (GFP) sequence of Aequorea

```
comprising a phosphorylation bolypeptide and a fluorescent protein or in operative linkage, a donor molecule, a phosphorylatable domain, a phosphorylation binding domain (PAABD) and an acceptor molecule. The phosphorylation indicators of the invention are useful for detecting kinases or phosphatases in a biological sample. They are also useful in high throughput analysis e.g. for detecting a kinase inhibitor or phosphatase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGFP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1, Application US/09062102

Patent No. 6130313

GENERAL INFORMATION:

APPLICANT: Kain, Steve

APPLICANT: Li, Xiangiang

TITLE OF INVENTION: Rapidly Degrading GFP-Fusion Proteins and Methods

TITLE OF INVENTION: of Use

FILE REFERENCE: D6100

CURRENT APPLICATION NUMBER: US/09/062,102

CURRENT FILING DATE: 1999-04-17

EARLIER FILING DATE: 1997-10-02
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OTHER INFORMATION: Sequence of the EGFP-MODC422-461 fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2, Application US/09513783A
Patent No. 6416959
GENERAL INFORMATION:
APPLICANT: Giuliano, Kenneth A.
APPLICANT: Kapur, Ravi
TITLE OF INVENTION: A System for Cell Based Scri
FILE REFERENCE: 97-022-L1
CURRENT APPLICATION NUMBER: US/09/513,783A
CURRENT FILING DATE: 2000-02-25
NUMBER OF SEQ ID NOS: 180
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 2
LENGTH: 294
Sequence 1, Application US/09364946
Patent No. 6306600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               98.5%;

; Patent No. 6191269
; GENERAL INFORMATION:
    APPLICANT: Lovett, David H.
    APPLICANT: Lovett, David H.
    APPLICANT: Turck, Johanna
    TITLE OF INVENTION: Selective Induction of Apoptosis in
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
    TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 LVTGLSYGVQCFSRYPDHWKQHDFFKSAMPEGYVOERTIFFKDDGNYKTRAEVKFEGDTL 120

Sequence 4, Application US/09887784
Facent No. US20020177189A1
GENERAL INFORMATION:
APPLICANT: BJOORN, Sara et al
TITLE OF INVENTION: NOVEL FLUORESCENT PROTEINS
FILE REFERENCE: 3759-01159
CURRENT APPLICATION NUMBER: US/09/887,784
CURRENT FILING DATE: 2001-06-19
NUMBER OF SEQ ID NOS: 24
SOFTWARE: Patentin version 3.0
SEQ ID NO 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TYPE: PRT

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
